
Supplementary Fig. 8. Dependence of species delimitation results on the *collapseheight* parameter in STACEY based on a reduced five-locus dataset (*tef1, rpb1, rpb2, CaM,* and *tub2*). The black solid line (left y-axis) represents the number of delimited species across different *collapseheight* values (x-axis). The red and turquoise lines represent the posterior probabilities of the most probable and second most probable delimitation scenarios, respectively (right y-axis). Vertical dashed lines indicate *collapseheight* values selected for subsequent species-delimitation analyses.
