Supplementary Fig. 9. Posterior similarity heatmap of isolates in the *Fusarium oxysporum* species complex inferred from the STACEY analysis at a *collapseheight* value of 0.00151. Colors represent posterior similarity values between isolates, with warmer colors indicating stronger support for their assignment to the same species cluster across the posterior distribution. Species clusters corresponding to the selected delimitation scenario are delineated by horizontal and vertical lines. The dendrogram on the left was derived from the STACEY analysis and is shown to illustrate the arrangement of isolates in the heatmap.
