Plant Pathol. J. 34(4):297-307 (2018)

In the original version of this article, there was an error in the scientific name in the title of Table 2, Table 3, Fig. 3 and Fig. 4. The correct version of the title of Table 2, Table 3, Fig. 3 and Fig. 4 are given below.

The publisher would like to apologize for any inconvenience caused.

Table 2. Morphometric comparison of second-stage juveniles (J2s) in *Heterodera trifolii* and *Heterodera schachtii*

Table 3. Morphometric comparison of vulval cone in *Heterodera trifolii* and *Heterodera schachtii*

Fig. 3. PCR pattern of COI gene and ITS region of *Heterodera trifolii* and *Heterodera schachtii* amplified with species-specific primers designed in this study (M: 100 bp DNA ladder). Primers of Hetero β -tubul were designed at the conserved region of beta-tubulin from the two *Heterodera* species. The information of each primer is available in Supplementary Fig. 1 and Supplementary Table 1.

Fig. 4. PCR patterns of ITS region (A) (approximately: 1,025 bp) and COI gene (B) (approximately: 450 bp) of *Heterodera trifolii* (YS503) and *Heterodera schachtii* (GC147) amplified with universal primers (DNA ladder: Bioneer 1 Kb DNA ladder). The information of each primer is available in Supplementary Table 1.
